The pdf is the same (as a pdf). I can scroll to the right/left, and change pages with the buttons. But when I try to print, it "lives" on a new page. I'm using "Print to PDF". The pdf looks great, and I can scroll to the right and left (using the middle button) as I want. I'm using Adobe Reader 10.0.2 on Windows 7. Is there a workaround for this? A: This appears to be an issue with the PDF driver, but Adobe Reader 10 was still working well with the same PDF file. As a result, it seemed less likely a PDF issue. Download and Install Acrobat Reader. Download the Standalone Acrobat Reader 32-bit version from Adobe. Extract the downloaded files to a directory on your computer. Double-click the AcrobatStandalone\_9.0.3-0.0.0.exe file to install the application. Once installed, close the application, and restart your computer. At the start of the program, enter your username and password to access the Acrobat program From the PDF file drop-down menu, select "Open with Adobe Reader". A message box will popup stating that the PDF file has been successfully opened with Acrobat Reader. If this doesn't work, download and install the latest version of Acrobat Reader from Adobe. There are a number of solutions for this, and some are more successful than others. Adobe Support suggests using the environment variable GACUTIL = ..\xsps9.0.dll and dcomcnfg to reset Acrobat Reader settings. This worked flawlessly for me. Also see: Support.Adobe.com: Read PDF files with Adobe® Reader Q: git delete file in index and sync? Let's say I want to remove a large file from git history. Obviously I have to first add it to the index. However, should I then use "git rm..." to remove it? What if I don't have enough space for that to happen? What if I want to keep it in the index in a subsequent pull request? A: You should use git rm to remove the file from the working directory, and git add to keep it in the index. That should leave the file unversioned. You may either use git push to push it to a remote

About Us Who are we? We are a group of young enthusiastic developers who came from all over the world to offer you the best games and applications for free. Here you can find all sort of tools and games for Windows, Mac OS X and even for mobile devices.Q: Can I be the "firewall's proxy"? Suppose that I am a part of the internet, a large part of the internet. I have only one single IP address. Can I be the "firewall's proxy"? A: A reverse proxy can be a firewall or a router. Both of them have ip address. They can proxy requests to the server's backend (the database, the server, app server, web server etc) with the help of ip address. It is an application that acts like a server, but routes or relays requests to other servers, which might be behind firewalls, and keeps track of the connection state for you. The proxy can make the backend server faster and cheaper because it can be virtualized and reside on the other side of the firewall/router. Q: What is a hash set? There are two API to make a hash set. set >::insert(const pair &p); set >::insert(const pair &p); The former is compiler-supported by MSVC, the latter is not. What is this special thing called? Is it std::unordered\_set? A: Standard: template struct hash ; template struct hash ; template struct hash ; template struct hash ; template struct hash ; struct hash > : public hash { typedef pair argument\_type ; hash(const argument\_type &arg) { size\_type h = arg.first ; size\_type l = arg.second ; this->add\_impl(h, l, static\_cast(arg.second) 3e33713323
