Dougherty and the Straight Goods We're
re-running our 2006 interview with
Australian poet and performer Bob
Dougherty. Along the way, I learn a few
things about Bob, his work and his life. I
also learn a few things about looking and
listening, especially about asking
questions and about resistance. Bob is a
poetry and performance artist who grew
up around the time of the sexual
revolution, in the early 1970s. So he
tends to look through a lens which sees
and hears things differently than I do. The
Outcasts of Parkes Almost anything you
want to know about Bob you can read

about on his blog, The Outcasts of Parkes, which is worth checking out if you haven't already. It's also a fine example of how Bob and I talk about poetry and other arts. e79caf774b

The paper presents a new content-based retrieval approach to manage big data. It can process data by a few hours for heavy-weight data and in the order of a few seconds for terabytes of light-weight data, just on a desktop computer. The underlying working model of our approach is the multiresolution paradigm. The main challenge of content-based retrieval is to find commonalities between documents in a large corpus of

documents. Since documents are usually comprised of unstructured words, and may be unbalanced in terms of length, this problem becomes NP-hard with respect to the query length. In contrast, the proposed approach processes data in the order of a few seconds and, unlike conventional approaches, it is able to handle large-sized, unbalanced queries in a fraction of a second. This is a novel contribution, since previous approaches were usually limited to searching a small number of query length, and they were usually much slower. We studied the problem and provided, first, a theoretical analysis, showing why current approaches are limited. Second, we developed a novel search engine, which relies on random projections and fast clustering algorithms. The main idea behind these algorithms is that they exploit a multiresolution representation of documents and queries, where words are

represented by hash codes. This representation is the basis of a linear search engine. Next, we present a clustering algorithm, based on the k-medoids algorithm, which selects the best medoid of a document cluster. The extensive experimental evaluation shows that the proposed technique is capable of processing large data sets in linear time with respect to the input data. We also compared the performance of our technique with classical approaches, focusing on the comparison with other state-of-the-art techniques. The results show that our approach is very competitive in terms of speed (processing time of our approach is 24% of other approaches) while it achieves a better performance in terms of recall. Related Work. Our search engine has applications in information retrieval as well as in data analysis. The main difference between our search engine and existing ones is

that the search engine proposed in this work is able to deal with large input data sets in short time. To the best of our knowledge, no previous work is able to handle data in such a short time. Another interesting aspect of the proposed approach is that the processing time is not related to the query length. This point is not highlighted by the analysis of related works, which is instead limited to the processing time of small query. . 3/
